## Gravity Probe B

Data Analysis Challenges, Insights, and Results

Mac Keiser<br>April 15, 2007

- Data Analysis Strategy and Methods
- Challenges and Insights
- Trapped Magnetic Flux and Slowly Changing Polhode Path
- Misalignment Torque
- Offsets in Gyroscope Spin Axis Orientation at Predictable Times
- Present Status and Future Prospects

## Data Collection Strategy and Limits on Potential Systematic Errors

| Initialization Phase |  | Science Data Collection Phase |  | Calibration Phase |
| :---: | :---: | :---: | :---: | :---: |
|  个  <br> Launch Gyroscopes Spun Up and Aligned Aug. 15, 2005 |  |  |  | 4 |
|  |  |  |  | Liquid Helium Depeleted |
|  |  |  |  | Sept. 29, 2005 |

- Initialization Phase
- Instrument Calibration
- Science Data Collection Phase
- Redundancy
- Internal Cross-Checks
- Calibration Phase
- Deliberate Enhancement of Disturbing Effects

## Science Data Collection:

Measurement of Gyroscope Spin Axis Orientation Relative to Guide Star

```
\DeltaGyro Pointing =
    \DeltaTelescope Pointing- }\Delta\mathrm{ Star
    (2 axes resolved by roll telescopes)
```

## Gyroscope Readout - Single Orbit

Data Analysis Procedure:

1. Find Ratios to Telescope to Gyroscope Scale Factors Using Attitude Errors
2. Combine Gyroscope and Telescope Signals
3. Calibrate Combined Signals Using Orbital Aberration

Combined Gyroscope 3 and Te le scope Signals, Orbit 6200, June 15, 2005

## Gravity ProB $^{a}$

London Moment Magnetic Field

TrappedMagentic Field

London Moment Readout:

- Rotating Superconductor Develops Dipole Field Aligned with Instantaneous Spin Axis
- Field at Surface of Rotor for Gyroscope Spinning at $80 \mathrm{~Hz}: 57.2 \mu \mathrm{G}$

Trapped Magnetic Field:

## Body-Fixed

- Gyroscope 1 - $3.0 \mu \mathbf{G}$
- Gyroscope 2 - $1.3 \mu \mathbf{G}$
- Gyroscope 3 - $0.8 \mu \mathbf{G}$
- Gyroscope 4 - $0.2 \mu \mathbf{G}$

Polhode Motion and Damping:

- Polhode Motion: Motion of spin axis within the body along the polhode path (Euler's Equations)
- Damping: Slow Relaxation of

Polhode Path toward maximum moment of inertia

## Data Analysis in Presence of Trapped Magnetic Flux

 and Polhode Motion- Impact on Data Analysis

1. Scale Factor is Modulated at Harmonics of Polhode Frequency

- Magnitude of Modulation ~ 1\%

2. Amplitude and Phase of Scale Factor Modulation Slowly Changes
3. Constant (Zero Frequency) Component Slowly Changes

Gyro 1 Scale Factor Modulation

- Solution:
- Divide data into batches with length up to 75 orbits (5 days)
- For Each Batch Estimate
» Modulation Coefficients at Known Polhode Period
» Constant Component of Scale Factor

# History of Gyroscope Spin Axis Orientation Relative to the Apparent Position of the Star 

Maximum Differences Between Apparent and True Guide Star Positions

|  | North-South | West-East |
| :--- | :---: | :---: |
| Annual Aberration | 11.0 arc sec | 19.1 arc sec |
| Parallax | 3 milli-arc sec | 5 milli-arc sec |
| Deflection of Starlight | 19 milli-arc sec | 15 milli-arc sec |

## Gravty Probe Changes in Gyroscope Spin Axis Orientation

## Elliptical Path Due to Annual Aberration

## Gravity History of Gyroscope Spin Axis Orientation ProBe Relative to the True Position of the Star

Proton Flux, Jan. 20, 2005, Measured by GOES Satellite

## Calibration Phase Discovery of a Misalignment Torque

- 19 Maneuvers to nearby stars or "virtual" stars
- Maximum misalignment 7 degrees
- Majority of maneuvers at 1 degree or less
- Maneuvers included variety of operating conditions for gyroscope suspension system and spacecraft translation control
- Electrostatic Suspension System Operated with
» Voltages Applied to Electrodes Modulated at 20 Hz
» DC Voltages Applied to Electrodes
- Deliberate Acceleration of the Spacecraft Along Roll Axis and Perpendicular to the Roll Axis
- Change in spacecraft roll period (77.5 sec to 120 sec )
- Calibration phase lasted from Aug. 15 through depletion of liquid helium on Sept. 29, 2005.

## Gyro 3 Misalignment Torques - Calibration Phase

Mean Rate (marc-s/day) vs. Mean Misalignment (arc-s)

For gyroscope 3

- drift rate is azimutal to measurement accuracy
- drift rate increases linearly with the misalignment angle up to 1500 arc sec.

## All Gyroscopes - Calibration Phase

## Mean Rate (marc-s/day) vs. Mean Misalignment (arc-s)

## Summary of Calibration Phase Results

- Drift rate is perpendicular to misalignment
- Torque coefficients as large as 2.5 as/day/deg
- Stability of misalignment torque coefficient
- Gyroscope 3:
» Gyroscope 3: Consistent calibration-phase results
» Offset following solar flare is consistent with magnitude of misalignment torque
» Sign of Torque Coefficient has changed from solar flare to calibration phase
- Other gyroscopes:
» Evidence for variation in torque coefficient during calibration phase
- Most Plausible Explanation:
- Interaction of patch effect fields on the gyroscope rotor with patch effect fields on the housing.

# Data Analysis in the <br> Presence of Misalignment Torques 

| Data |
| :---: |
| simulated |
| for |
| illustration |
| purposes |

- Radial Component of Drift Rate Contains NO Contribution from Misalignment Drift
- Magnitude and Direction of Uniform (Relativistic) Drift Rate May Be Determined From Variation of Radial Component with Misalignment Phase

## An Additional Observation: Offsets in

 Gyroscope Spin Axis Orientation

Data is Not Used in Analysis When an Harmonic of Polhode Frequency Coincides with Satellite Roll Frequency

## Gravity ProBe <br> Relativistic Drift Rate - All 4 Gyroscopes

Consistency between gyroscopes and data runs better than 100 mas/year.

## A complementary data analysis approach:

 Algebraic Method- Method:
- Determine Gyroscope Spin Axis Orientation from Short-Term Analysis
- Simultaneously Estimate Relativistic Drift Rate and Misalignment Torque Coefficient Using Known History of Satellite Roll Axis Orientation

|  | Geometric Method | Algebraic Method |
| :--- | :--- | :--- |
| Short Term Analysis | -10 to 75 orbits <br> - Modulation of Scale Factor at <br> Polhode Frequency | $\bullet 1$ to 5 orbits <br> $\bullet$ Modulation of Scale Factor at <br> Polhode Frequency |
| Information for Long Term <br> Analysis | Gyroscope Drift Rate | Gyroscope Spin Axis Inertial <br> Orientation |
| Additional Information <br> Needed | Misalignment between satellite <br> roll axis and gyroscope spin <br> axis | Inertial Orientation of Satellite Roll <br> Axis |
| Long Term Analysis | Relativistic Drift Rate and <br> Misalignment Torque | • Relativistic Drift Rate <br> Misalignment Torque <br> $\bullet$ Polhode Variations of Scale Factor <br> $\bullet$ Continuous Dynamic Estimation of |
| Gyroscope Orientation |  |  |

Two Complementary Data Analysis Methods Provide Valuable CrossChecks and Additional Insight

Geodetic / Frame-Dragging Estimates

Error Ellipses Show Statistical Error Only

## Initial Geodetic Effect Results

'Geometric'
'Algebraic'

## Summary

- Solutions to Difficulties in Data Analysis Have Been Found

1. Trapped Flux and Changing Polhode Path

Solution: Estimate Modulation and Constant Components of Scale Factor for Batches up to 75 orbits long.
2. Misalignment Torques

Two Complementary Solutions: Geometric and Algebraic Methods
3. Offsets in Gyroscope Positions When Harmonics of Polhode Frequency Coincide with Satellite Roll Frequency
Solution: Do not use data near resonances

- All Four Gyroscopes are Consistent with One Another and with Drift Rate Predicted by General Relativity to better than 100 mas/yr.
- Formal Statistical Error is Significantly Smaller than Typical Inconsistencies Between Gyroscopes or Between Data Runs

## Gravity Methods for Improving Consistency of Results ProBe

- Trapped Magnetic Flux and Polhode Motion

1. Include temporal variation of scale factor modulation
2. Use known polhode path
3. Trapped Flux Mapping
4. Crosschecks;
» Annual Aberration
» Flux Slipping

- Misalignment Torques

1. Provide for slowly changing torque coefficient and misalignment
2. Tighten Limits on Misalignment Torques due to Incomplete Roll Averaging

- Offsets in Gyroscope Spin Axis Orientation When Harmonics of Polhode Coincide with Roll Frequency

1. Compare data with physical model
2. Include additional terms in data analysis or modify data selection criteria
